Highly sensitive and specific assays for the detection of *Salmonella* enteritidis (SE) and *Salmonella* typhimurium (ST) were developed and evaluated. The assays were based on the use of monoclonal antibodies (MAbs) that recognize specific epitopes of the enteric serotypes. The MAbs were used in a dot-blot immunoassay (DBIA) and in a rapid, sensitive, and specific enzyme-linked immunosorbent assay (ELISA). The DBIA was used to detect SE and ST in a mixture of 10⁵ CFU of SE and ST in a mixture of 10⁵ CFU of SE and ST. The ELISA was used to detect SE and ST in a mixture of 10⁵ CFU of SE and ST in a mixture of 10⁵ CFU of SE and ST. The results of the DBIA and ELISA were compared with the results of the standard culture method. The DBIA and ELISA were found to be highly sensitive and specific for the detection of SE and ST. The DBIA was found to be more sensitive than the ELISA for the detection of SE and ST. The ELISA was found to be more specific than the DBIA for the detection of SE and ST. The results of the DBIA and ELISA were compared with the results of the standard culture method. The DBIA and ELISA were found to be highly sensitive and specific for the detection of SE and ST. The DBIA was found to be more sensitive than the ELISA for the detection of SE and ST. The ELISA was found to be more specific than the DBIA for the detection of SE and ST.
